BV Series Vane Pump

The BV series is available in four versions of single pump (from 10 to 285 l/min at 1500 rpm) and six versions of double pump (from 68 to 462 l/min at 1500 rpm), with maximum powers of over 225 kW. The BV series pumps are extremely compact and are supplied with ISO norm mechanical couplings and SAE norm hydraulic fittings. This makes them very easy to install and guarantees their interchangeability with other similar pumps.

BQ Series Vane Pump

The BQ series is available in five versions of single pump (from 10 to 285 l/min at 1500 rpm) and seven versions of double pump (from 68 to 462 l/min at 1500 rpm), with maximum powers of over 225 kW. The BQ series pumps are extremely compact and are supplied with ISO norm mechanical couplings and SAE norm hydraulic fittings for easy installation and guarantees their interchangeability with other similar pumps.

TQ & TV Series Vane Pump

Thru-drive pumps save installation space and cost by eliminating double shaft extension electric motors or by reducing the number of motors and drive couplings.

Furthermore thru-drive models provide valuable circuit design flexibility, such as having the vane pump coupled with other types of pumps, both fixed and variable displacement, on a single input drive.

The B&C thru-drive pumps are available in TQ and TV versions. The ten vane TQ type is particularly suitable for applications subject to sudden peaks of pressure, while the twelve vane TV model is specifically designed to meet very low noise requirements.

HQ Series Vane Pump

The HQ series is available in 2 versions of single pump (from 58 to 132 l/min at 1500 rpm) and two versions of double pump (from 69 to 200 l/min at 1500 rpm) with maximum powers of over 103 kW.

The pumps are extremely compact and are supplied with different types of either ISO or UNI norm mounting for the direct coupling with PTO and SAE norm hydraulic fittings. That, together with the possibility to orientate the inlet and outlet ports, makes the HQ pumps very easy to install and guarantees their interchangeability with other types of pumps.

B1 & B2 Series Vane Pump

B1 and B2 pumps combine versatility, reliability, high long-term volumetric efficiency and low noise, with low running costs to offer a valid alternative to other types of pump for both industrial and mobile use, particularly where noise level must be kept low. B1 pumps are available in eight different versions (from 5 to 33 l/min at 1500 rpm), with maximum power of up to 18 kW; B2 pumps are available in seven different versions (from 28 to 62 l/min at 1500 rpm) with maximum power of up to 27 kW. Both are supplied with different mechanical and hydraulic connections, for extremely simple installation and complete interchangeability with other types of pump.

Cartridge Components

Flexible side plates
Counter-pressure chambers

Versatility, power, compactness and low running costs are the main characteristics of the latest pump product release available from jbj Techniques Limited. All components subject to wear are contained within a replaceable cartridge which allows **inspection and maintenance without disconnecting the pump** from the circuit, thereby drastically reducing system down time.

The cartridge consists of a rotor, vanes and inserts, a cam ring, two flexible plates and two covers. During operation the rotor is driven via a splined shaft coupled to the drive ring. As the rotational speed increases, centrifugal forces, combined with the pressure generated behind the vanes, extend the vanes outwards where they follow the profile of the cam ring with sufficient contact pressure to ensure adequate hydraulic sealing. The two opposed pumping chambers, formed by the elliptical profile of the cam, cancel out radial loads on the shaft bearings, thus giving **extremely long working life**.

The vane pumps are designed to meet the requirements of the most varied industrial and mobile applications. In fact, as well as their proven high reliability and **excellent volumetric efficiency** in all working conditions, they operate with particularly **low noise levels**. This is made possible by the special profile of the cam ring and the use of a 12 vane rotor that reduces the amplitude of the supply pressure pulses, thereby reducing induced vibration.

www.jbj.co.uk/vanepumps.html

jbj Techniques Ltd provide a diverse range of mechanical drive & transmission solutions to industrial markets including design engineering, product supply and after sales service.

An experienced and dedicated team of technical sales engineers are on hand to work with customers and deliver results.

The markets where jbj operate are tough and time sensitive. In such circumstances customers need reliable solution partners, people who are conscious of deadlines, innovative in design and always willing to seek the best solution for the customers' needs.

On all counts, jbj Techniques Limited deliver. From specification, through technical advice, manufacture and support, together with our extensive product database, jbj Techniques provide a comprehensive and valued service to the power transmission and hydraulic industries.

Vane pumps provide versatility, power, compactness and low running costs.

Drastically reduce expensive machine down time.

All the components subject to wear within these vane pumps are contained in a cartridge unit that can be easily removed for inspection and/or replacement without disconnecting the pump from the circuit, drastically reducing expensive machine down time.

The cartridge contains a rotor, vanes and inserts, a cam ring, two flexible plates and two covers. During operation the rotor is driven by a splined shaft coupled to the drive unit. As the rotation speed increases, centrifugal forces, in combination with the pressure generated behind the vanes, push the vanes outwards, where they follow the profile of the cam with a sufficient contact pressure to ensure adequate hydraulic sealing. The two opposed pumping chambers formed by the elliptical profile of the cam cancel out radial loads on the shaft bearings, thereby giving them extremely long lifetimes.

The design characteristics of these vane pumps make them particularly suited to applications in the mobile field. The special design of the flexible plates enables any thermal expansion in the rotor to be compensated for and to adequately cope with any sudden change in pressure. Furthermore, the counter-pressure chambers positioned between the flexible plates and the cartridge covers balance the internal pressure; this ensures that the correct clearance between the rotor and the flexible plates is always maintained so guaranteeing maximum volumetric efficiency.

The versatility of these vane pumps enables them to meet the requirements of the most varied industrial applications. In fact, as well as their proven high reliability and excellent volumetric efficiency in all working conditions, they operate with particularly low noise levels. This is made possible by the special profile of the cam ring and the use of a 12 vane rotor that reduces the amplitude of the supply pressure pulses, thereby reducing induced vibrations.

These vane pumps are extremely compact and are supplied with ISO norm mechanical couplings and SAE norm hydraulic fittings. This makes them very easy to install and guarantees their interchangeability with other similar pumps (eg. Vickers, Caterpillar, Denison).

More detailed technical information is available in the catalogues of the standard B & C range of vane pumps available from jbj Techniques Limited.
